AviaVox Generic

artificial intelligent airport announcement system

The solution to support automatic announcements at your airport is based on a phoneme technology that is far more superior to a traditional TTS-System or a pre-recorded system. An AviaVox-system has been designed for usage in a professional environment like an airport.

AviaVox specializes in announcement systems for airports and airlines based on an entire new technology. Our systems are specifically designed for the airport- and airline environment and we have a rich set of optional features that automate the operational process at the departure gate and the general PA-zones to a maximum.

The AviaVox system offers far more than purely an automatic announcement system and solves specific airport related issues. Moreover, we integrate with the operational processes at an

airport and as such, we integrate with the daily operations.

Using an AviaVox-system will highly contribute to the operational processes at the airport improving the passenger flow from the terminal building to the gates. Within the restricted area of the gates the boarding processes can be further optimized by using the optional AviaVox Airline-Gate-Client. All this can be done against a minimum of operational costs per year, because it is charged on an annual subscription base.

The AviaVox Generic Announcement system is an integrated solution connecting:

- Airport Operational Data Base (AODB);
- Interface Broker, as an alternative to the above;
- Public Address System (PAS / PBX);
- Private Automatic Branch Exchange (PABX);
- Local Area Network (LAN);
- Internet access.

Because of the increased efficiency, large international airports have chosen to implement our systems, such as: London Heathrow | Amsterdam Schiphol | New Delhi | Manchester | Brussels Kuwait | Genova | Billund | Cairo | Moscow | Faro | Lisbon

More detailed information can be obtained through our website and in case you would like to have a presentation, please contact us.

info@aviavox.com

Airport announcement system:

Flight related announcements
Non-flight related announcements
Tailor made announcements

Language support & maintenance:

Already 19 different languages available
Continuously expanding voice-base
Automatic voice-base maintenance

Airport Operations and Integration:

Interfaces to the AODB or Interface Broker
Uses existing PA-systems / PABX systems

Supports the announcement policy of an individual airport

Revolutionary Digital System:

Based on digital speech fragments (phonemes)
High Intelligibility / Audibility
Reduces airport noise pollution

Easy to use:

User-friendly Graphical Interface
Fully automatic (manual operation possible)
Automatic voice-base maintenance
